Lab 03 - Boolean Problems & Function Definitions

Direction: Submit your typed work(s) as an upload(s) to the Labs directory of your GitHub repository or Dropbox, or in your correct Lab03 google classroom assignment. Each part should be a separate files. The files named should be "lab3A.txt" and "lab3B.cpp" respectively.

Part A: In class

Your objective is to write the boolean expres	ssions that are described	below. Assume that the	ne variables in the descriptions
are already initialized.			

Write an ex	pression	that	determines	if two	integers.	a and b	, are	consecutive	numbers.

- \Box Write an expression that determines if a day, dy, fell on a Thursday in the month of October 2020 (the first Thursday is on the 8th).
- \square Write an expression that determines if an integer, n, is a negative four digit number.
- \square Write an expression that determines if a string, wd, equals "so" ignoring case.

Part B: Take home

Your objective is to write a complete cpp program that defines the following functions and calls them in the main function.

- \square An int function named ProductOfFive() that takes an int parameter named n. It returns the product of five consecutive integer starting from n.
- A void function named Swap() that takes three char reference parameters named s, t and u respectively. It swaps the values of the parameters so that no parameter is equal to its original value, but all values are maintained. You can assume that the values of the parameters are distinct.
- □ A string function named CapitalI() that takes no parameters. It returns a string equal to
